                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the brain. This receptor is activated by the binding of D-serine.

Regulation of D-serine levels through regulation of serine racemase may therefore prevent or minimise neuron damage in neurogenic and may therefore prevent or minimise neurons and respect to the neurons of disease in mer and shall also and chronic pain. The invention provides serine racemase and chronic pain. The invention provides serine racemase polypeptides and methods for their recombinant production. These polypeptides are used in claimed methods of screening for agents that modulate or decrease serine racemase activity. A claimed paramaceutical composition comprising either an expression vector that contains a serine racemase polynucleotide, or a reagent that modulates serine racemase polynucleotide, or a reagent that contains a serine racemase polynucleotide, or a reagent that serine racemase enzyme activity, is used to modulate serine racemase enzyme activity, is used to modulate serine racemase activity in a disease, particularly neuron damage or a neurodegenerative disease caused by the over- or under-activation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               YGASIVYCDPSDESREKVTQRIMQETEGILVHPNQEPAVIAGQGTIALEVLNQVPLVDAL

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to novel genes (ABL89449-ABL90853) and proteins (ABB89040-ABB90444) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's
                                                                       Novel 1405 isolated polypeptides, useful for diagnosis, treatment and prevention of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                  (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 MCAQYCISFADVEKAHINIQDSIHLTPVLTSSILNQIAGRNLFFKCELFQKTGSFKIRGA

polymetrase chain reaction (FR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II) repressed chain reaction (FR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymeteotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat diseases states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markets and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating the polypeptide and polyuculeotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and and to produce other types of data and products dependent on DNA and and cain acid sequences. ABGONOTO-BASSONOT represent novel human caid sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the inview of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        102 AYIVVPQTAPNCKKLAIQAYGASIV-YCDPSDESREKVTQRIMQETEGILVHPNQEPAVI 160

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents a mutant Arabidopsis thaliana threonine dehydratase/deaminase (TD) protein of the invention. The protein is a feedback insensitive mutant. The TD DNA sequence is used as molecular marker (imparting resistance to toxic structural analogues of isoleucine) for selecting transformed cells and to produce transformants with increased levels of isoleucine (and thus better nutritional value) or of intermediates in biosynthesis of isoleucine (e.g. 2-oxobutyrate, for synthesis of the degradable biopolymer poly(hydroxybutyrate). Also repressing plants permit use of the isoleucine structural analogues as herbicides. The DNA sequences are alternatives for antibiotic resistance markers (which are potentially harmful to the environment). Since no because the contraction of the isoleucine) it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   116 TVVLFGDSYDQAQAHA--KIRAEEGLIFIPPPDHPDVIAGQGTVGMEITRQAKGPL-HA 172

It lacks the chloroplast transit peptide of the mutant TD precursor, and is encoded by a polynucleotide (see AAX25334) that is one of 9 calimed polynucleotides (see AAX25332-40), originally isolated and cloned from A. thaliana mutant line GM1b (omr1/omr1), which encode a feedback insensitive TD. These polynucleotides can be used to transform a wide variety of plants, fungi, bacteria and yeast. The polynucleotides differ from the wild-type only by 2 point mutations, which result in R499C and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New sequences encode mutant threonine dehydratase/deaminase - which is insensitive to feedback inhibition, useful as a selective marker to produce transformed cells resistant to toxic isoleucine analogues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Threonine dehydratase/deaminase; omr1 gene; feedback inhibition;
transgenic plant; selectable marker; isoleucine; mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents an Arabidopsis thallana mutant mature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Feedback insensitive mature threonine dehydratase/deaminase.

R554H amino acid substitutions (numbering according to wild-type TD) in the R4 and R6 regulatory regions. These forms of TD are not only insensitive to feedback inhibition by isoleucine, but are also planes and microorganisms which synthesise only wild-type TD. Nucleotide sequences encoding mutated forms of TD can therefore be used to create cells that are lissensitive to compounds normally toxic to cells expressing only wild-type TD encymes, and thus may be used to provide a biochemical selectable marker. Transformants harboring a nucleotide sequence competising a promoter operably linked to a mutated TD sequence demonstrate increased levels of isoleucine production, and thus provide an improved nutrient source.
                                                                                                                                                                                                                                                                                     34;

This sequence represents a mutant Arabidopsis thaliana threonine dehydratass/deaminase (TD) protein of the invention. The protein is a feedback insensitive mutant. The TD DNA sequence is used as molecular marker (imparting resistance to toxic structural analogues of isoleucine) for selecting transformed cells and to produce transformants with increased levels of isoleucine (and thus better nutritional value) or of intermediates in biosynthesis of isoleucine (e.g. 2-oxobutyrate, for synthesis of the degradable biopolymer poly(hydroxybutyrate). Also TD-expressing plants permit use of the isoleucine structural analogues as herbicides. The DNA sequences are alternatives for antiblotic resistance markers (which are potentially harmful to the environment). Since no human analog of TD exists (humans can not synthesize isoleucine), it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                IRGLIPDTPEEKPKAVVTHSSGNHGQALTYAAKLEGIPAYIVVPQTAPNCKKLAIQAYGA 123

                                                                                                                                                   g
                                                                                                                                                                                                                                                This sequence represents an Arabidopsis thaliana mutant mature threonine dehydratase/deaminase (TP) which, unlike the wild-type enzyme (see AAV05702), is insensitive to feedback inhibition by soleucine. It lacks the chloroplast transit peptide of the mutant TD precursor, and is encoded by a polynucleotide (see AAX5336) that is one of 9 claimed polynucleotides (see AAX53332-40), criginally isolated and cloned from A. thaliana mutant line GMIlb (omr1/omr1), which encode a feedback insensitive TD. These polynucleotides can be used to transform a wide variety of plants, clung, bacteria and yeast. These polynucleotides differ from the wild-type only by 2 point mutations, which result in R499C and R554H amino acid substitutions (numbering according to wild-type only insensitive to feedback inhibition by isoleucine, but are also insensitive to structural analogues of isoleucine that are toxic to plants and microorganisms which synthesise only wild-type TD. Concepting experiences encoding mutated forms of TD can therefore be used to create cells that are insensitive to compounds normally
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     64 IRGLIPDTPEEKPKAVVTHSSGNHCQALTYAAKLEGIPAYIVVPQTAPNCKKLAIQAYGA 123

synthesis of the degradable biopolymer poly(hydroxybutyrate)). Also TD-expressing plants permit use of the isoleucine structural analogues as herbicides. The DNA sequences are alternatives for antibiotic resistance markers (which are potentially harmful to the environment). Since no human analog of TD exists (humans can not synthesize isoleucine), it
                       ----AMALSLHHGERVILD 253
                                                                                                                           dehydratase/deaminase (TD) protein of the invention. The protein is a feedback insensitive mutant. The TD DNA sequence is used as molecular marker (imparting resistance to toxic structural analogues of isoleucine) for selecting transformed cells and to produce transformants with increased levels of isoleucine (and thus better nutritional value) or of intermediates in biosynthesis of isoleucine (e.g. 2-oxobutyrate, for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             molecular marker, isoleucine toxic structural analog resistance; isoleucine production; biosynthesis; degradable biopolymer; herbicide; polyhydroxybutyráte; antibiotic resistance marker; mutein.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       900
                                                                                                                                               The present sequence encodes a mammalian serine racemase, which has a specific activity of at least 0.003 micromole L.serine/mg/hour. The enzyme catalyses the direct racemisation of L.serine to peserine. D-serine appears to be an endogenous ligand of N·methyl-D-aspartate (NMDA) receptors. The mammalian serine racemases can be used to identify nedulators, which can be used in the treatment of acute or chronic neural death or dysfunction mediated by overactivation of N·methyl-D-aspartate (NMDA) receptors. Overactivation of the receptors is associated with Parkinson's disease, Huntington's disease, motor neurone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      360

The invention relates to a recombinant polynucleotide encoding a numan serine racemase, vectors containing it, host cells expressing the racemase, wethods of identifying inhibitors of serine racemase and a transgenic animal lacking a functional endogenous serine racemase comprising the human serine racemase of the invention. The racemase comprising the human serine racemase of the invention. The racemase comprising the human serine racemase of the invention. The racemase comprising the human serine racemase of the protein and in structural studies of the protein and serine racemase cruckfunction relationships of the protein and structure/function relationships of the protein and structure/function relationships of the protein and serine racemase polymeptide have diagnostic, therapeutic or prophylactic uses (e.g. converged and mutant or polymorphic forms of the serine racemase, and the serine racemase (and serine racemase function. The polymocrebellar ataxia and schizophrenia), and would be useful for screening for modulators and/or inhibitors of serine racemase function. The polymocleotides encoding a serine racemase function, and as primers for nucleic acid emplification based assays for the detection of polymucleotides encoding serine racemase protein. The transgenic animal is useful for the study of the tissue and temporal specific animal is useful for the strine racemase gene in an animal. The gene for human serine racemase is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       δ
                                                                                                                          dependent enzyme 23406 which is a serine remease. Human 22406 gene is located on chromosome 17 between D178849 and D175796. The protein 22406 is a modulator of D-serine. D serine has been shown to modify behavioural changes associated with learning, memory and convulsions. Human 22046 and compounds that modulate the expression or activity are used to treat or diagnose neurodegenerative disorders including Alzheimer's disease, schizophrenia as well as quell anxiety and explicitly and prevent damage from stroke as well as cardiac (heart failure, rheumatic heart failure) and circulatory disorders, inver disorders (hepatic injury, jaundice), lung disorders, prostrate disorders (hepatic injury, jaundice), lung disorders, colon disorders (atresia, stenosis), skeletal muscle disorders (tumours-rhabdomyosarcoma) and dermal fibroblast disorders. Human 22406 cDNA is also useful in gene
                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          128

to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprises a 5'-end sequence of an oligonucleotide comprises a 1'-end sequence, where the oligonucleotide which comprises a 1'-end sequence, where the oligonucleotide which comprises at least 15 nucleotides and the combination of the 5'-end sequence, 3'-end sequence, sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length CDNAs. The primers allow obtaining of the full-length CDNAs. The primers allow obtaining of the full-length CDNAs. The primers and methods. P-PSDB; Key **AAI6502**C RESULT ò qq ò g ò g pp Op ŏ ŏ à g ö 120 180 240 171 231 291 351 360 411 TACGGAGCGTCAATTGTATACTGTGAACCTAGTGATGAGTCCAGAGAAAATGTTGCAAAA 420 480 531 540 591 900 651 999 711 720 9 serine racemase polynucleotides. Expression vectors and host cells are claimed. Serine racemase catalyses the conversion of L-serine to D-serine. Neuron damage following various nervous system diseases is often caused by activation of gultamate N-methyl-D-aspartate (NMDA) receptors in the brain. This receptor is activated by the binding of D-serine. Regulation of D-serine levels through regulation of serine racemase may therefore prevent or minimise neuron damage in neurogenic and myopathic disorders, mountained parkinson's disease, and disorders leading to peripheral and chronic pain. Serine racemase polypeptides and polynucleotides are used in claimed methods of screening for agents that modulate or used in claimed methods of screening for agents that modulate or 1 ATGTGTGCTCAGTATTGCATCTCCTTTGCTGATGTTGAAAAGCTCATATCAACATTCGA AATCTTTTCTTCAAATGTGAACTCTTCCAGAAAACAGGATCTTTTAAGATTCGTGGTGCT CTCAATGCCGTCAGAAGCTTGGTTCCTGATGCTTTAGAAAGGAAGCCGAAAGCTGTTGTT 421 AGAGTTACAGAAGAAACAGAAGGCATCATGGTACATCCCAACCAGGAGCCTGCAGTGATA AAGCTGAAGGGGAAACTGATGCCCAATCTTTATCCTCCAGAAACCATAGCAGATGGTGTC GATTCTATCCACCTCACACCAGTGCTAACAAGCTCCATTTTGAATCAACTAACAGGGCGC GCTGGACAAGGGACAATTGCCCTGGAAGTGCTGAACCAGGTTCCTTTGGTGGATGCACTG GTGGTACCTGTAGGTGGAGGAATGCTTGCTGGAATAGCAATTACAGTTAAAGGCTCTG AAACCTAGTGTGAAGGTATATGCTGCTGAACCCTCAAATGCAGATGACTGCTACCAGTCC decrease the activity of serine racemase. Also claimed is a pharmaceutical composition comprising either an expression vector that contains a serine racemase polynuclectide, or a reagent that modulates serine racemase enzyme activity. This is used to modulate serine racemase activity in a disease, particularly neuron damage or a neurodegenerative disease caused by the over or under-activation 0; Gaps Score 1021.4; DB 22; Length 1336; Pred. The present sequence encodes a mammalian serine racemase, which has a specific activity of at least 0.003 micromole L-serine/mg/hour. The enzyme catalyses the direct racemisation of L-serine to D-serine. D-serine appears to be an endogenous ligand of N-methyl-D-aspartate (NMDA) receptors. The mammalian serine racemases can be used to identify modulators, which can be used in the treatment of acute or chronic neural death or dysfunction mediated by overactivation of N-methyl-D-aspartate (NMDA) receptors. Overactivation of the receptors is associated with Parkinson's disease, Huntington's disease, motor neurone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9

```
The present sequence encodes a mammalian serine racemase, which has a specific activity of at least 0.003 micromole L-serine/mg/hour. The enzyme catalyses the direct racemisation of L-serine to D-serine. D-serine appears to be an endogenous ligand of N-methyl-D-asparate (NMDA) receptors. The mammalian serine racemases can be used to identify modulators, which can be used in the treatment of acute or chronic neural death or dysfunction mediated by overactivation of N-methyl-D-asparate (NMDA) receptors. Overactivation of the receptors is associated with Parkinson's disease, Huntington's disease, motor neurone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GATTCTATCCACCTCACACCAGTGCTAACAAGCTCCATTTTGAATCAACTAACAGGGCGC 120

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comptises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises a squence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence. Sequence complementary to a joynucleotide which comprises a 1 east 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the 5'-end sequence/3'-end sequence is selected from those defined in gree therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the primers useful for synthesising polynucleotides, particularly without any specialised methods. AAH03166 to AAH13628 and AAH13633 cepresent human amino acid sequences; and AAH13629 to AAH13632 represent invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the
                                                                                                                                                                                                                                                                                                               Yamamoto J;

The invention relates to novel genes (ABL89449-ABL90853) and proteins (ABB89040-ABB90444) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast on ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and parasitic infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               106

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     racemase gene. The racemase polypeptide has a specific activity of at least 0.003 micromole L-serine/mg/hour. The enzyme catalyses the direct racemisation of L-serine to D-serine. D-serine appears to be an endogenous ligand of N-methyl-D-aspartate (MMDA) receptors. The mammalian serine racemases can be used to identify modulators, which can be used in the treatment of acute or chronic neural death or dysfunction mediated by overactivation of N-methyl-D-aspartate (NMDA) receptors. Overactivation of the receptors is associated with Parkinson's disease, Huntington's disease, motor neurone disease and Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 ATGTGTGCTCAGTATTGCATCTCCTTTGCTGATGTTGAAAAAGCTCATATCAACATTCGA

        can be used in the treatment of acute or chronic neural death or dystunction mediated by overactivation of N-methyl-D-aspartate (NMDA) receptors. Overactivation of the receptors is associated with Parkinson's disease, Huntington's disease, motor neurone disease and Alzheimer's disease.

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Disclosure; SEQ ID NO 8040; 1701pp + Sequence Listing; English.

identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from noligo-dry primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intext 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design

The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The polypeptides can also be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelld infections, food poisoning, osteomyelitis, syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences contained on the computer readable madium

                                                                                                                                                                                                                                                                                                                                                                                                                                                          240
                                                                                                                                                                D-serine appears to be an endogenous ligand of N-methyl-D-aspartate (NMDA) receptors. The mammalian serine racemases can be used to identify modulators, which can be used in the treatment of acute or chronic neural death or dysfunction mediated by overactivation of N-methyl-D-aspartate (NMDA) receptors. Overactivation of the receptors is associated with Parkinson's disease, Huntington's disease, motor neurone
                                                                                                                                                                                                                                                                                                                                                                                 9
                                                                                                                                                                                                                                                                                                                                                                                                            9
              Mammalian serine racemase preparations, used to identify modulators which can be used to treat diseases associated with N-methyl-D-aspartate receptor overactivation, e.g. Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; serine racemase; Parkinson's disease; Huntingdon's disease; anxiety; glaucoma; stroke; hyperalgesia; pain; spinocerebellar ataxia; schizophrenia; transgenic animal; chromosome 17pl3; immunogen.
                                                                                                                       racemase, which has

human serine racemase, vectors containing it, host cells expressing the cacemase, methods of identifying inhibitors of serine racemase and a transgenic animal lacking a functional endogenous serine racemase and transgenic animal lacking a functional endogenous serine racemase comprising the human serine racemase of the invention. The racemase comprising the human serine racemase of the invention. The racemase comprising the human serine racemase of comprising the racemase comprising the human serine standing of the protein and structural studies of the protein and structural studies of the protein and construction relationships of the protein. Biologically active construction relationships of the protein. Biologically active structure/function relationships of the protein. Biologically active comprehensive and and transgenical diseases such as Parkinson's and Huntingdon's disease, anxiety, glaucoma, strucke, hyperalgesia, pain, spinocerebellar ataxia and consideration of serine racemase function. The polynucleotides are useful continuity of serine racemase function and as primers for nucleic actide amplification based assays for the detection of polynucleotides encoding conding a serine racemase protein. The transgenic animal is useful for the strine racemase protein. The transgenic animal is useful for the strine racemase protein. The present sequence represents human serine racemase gene in an animal. The gene for human serine racemase in an animal. The gene for human serine racemase conding a care of the present sequence represents human serine racemase conding and activity of the serine racemase gene in an animal. The gene conding activity of the serine racemase gene in an animal. The gene conding a serine racemase serine racemase gene in an animal The gene for human serine racemase serine racemase decomase in an animal racemase decomase is a problem of protein racemase serine racemase serine racemase serine racemase in an animal racemase serine racemase serine racemase in an animal racemase serine racemase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             LNAVRSLVPDALERKPKAVVTHSSGNHGOALTYAAKLEGIPAYIVVPOTAPDCKKLAIQA 120
